STATE OF RHODE ISLAND and PROVIDENCE PLANTATIONS

The Honorable Lincoln D. Chafee, Governor

RHODE ISLAND DEPARTMENT OF HEALTH

VITAL STATISTICS

ANNUAL REPORT

2003

Michael Fine, MD, Director of Health

Colleen A. Fontana, State Registrar, Vital Records

INTRODUCTION

This Rhode Island Vital Statistics Annual Report for the year 2003 has been released by the Office of Vital Records in the Rhode Island Department of Health. The report contains data from certificates filed in the Division of Vital Records, as required by state law, for vital events such as births, deaths, marriages, divorces and fetal deaths occurring in Rhode Island. Information was also extracted from transcripts of certificates filed in other states for births and deaths occurring to Rhode Island residents in other locales.

The publication of the Vital Statistics Annual Report for 2003 is the final stage of a long process requiring the cooperation of many dedicated professionals, from health care providers to municipals clerks to funeral directors. All the unique data, once received at the Office of Vital Records, provide the public with certification that the event happened and, for public health purposes, provide important medical and statistical information, which is the foundation of this book and program and many other programs in Rhode Island.

The collection and organization of these data are partially supported by a contract with the National Center of Health Statistics (NCHS) a division of the National Center for Disease Control and Prevention, US Department of Health and Human Services, as part of Rhode Island participation in the US Vital Statistics Cooperative Program. Rhode Island Vital Statistics Annual Report 2003 is primarily for general reference. More detailed data may be available from the Office of Vital Records, 3 Capitol Hill, Room 101, Providence, RI 02908-5097. This report is also available on the Health Department website at www.health.ri.gov.

ACKNOWLEDGEMENTS

Publication of the Vital Statistics Annual Report requires the efforts of many staff members from the Division of Vital Records and in particular, special thanks are extended to Lawrence Trejo, Angel Reyes and MaryJo Takach.

Colleen A. Fontana
State Registrar, Vital Records
October 15, 2012

Vital Statistics Annual Report 2003

TABLE OF CONTENTS

VITAL STATISTICS SUMMARY

TABLES & FIGURES

DEFINITIONS OF TERMS

Birth or live birth

Is defined as the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

Cause of Death

The underlying cause of death, by which all deaths are classified, may be defined as:

(a) the disease or injury which initiated the train of morbid events leading directly to death, or

(b) the circumstances of the accident or violence which produced the fatal injury.

It is the responsibility of the certifying physician or medical examiner to indicate the underlying cause. It is the responsibility of the nosologist in the Division of Vital Records to assign the proper code number from the Tenth Revision, International Classification of Diseases, so that deaths may be classified by underlying cause. Because of the classification revision, cause-of-death figures beginning with 1999 data are not entirely comparable with those of earlier years (see "Changes to Mortality Data Classifications: ICD-9 to ICD-10" in the Technical Notes section of this report).

Census Tract

The U.S. Census Bureau defines a census tract as "a small, relatively permanent statistical subdivision of a county delineated by a local committee of census data users for the purpose of presenting data. Census tract boundaries normally follow visible features, but may follow governmental unit boundaries and other non-visible features in some instance; they always nest within counties. Designed to be relatively homogeneous units with respect to population characteristics, economic status, and living conditions at the time of establishment, census tracts average about 4,000 inhabitants." (Source: www.census.gov)

In 1990, some Rhode Island census tracts were redrawn so that they crossed town lines. The majority of 2000 census tracts have been corrected for this problem, and fall within town boundaries. Many 2000 census tracts, however, have been moved, shifted, split, or combined relative to the 1990 tracts. We recommend that data coded to 1990 census tracts not be compared to data coded to 2000 census tracts, unless you are aware of how the tract has changed, even if its number has remained the same. Additional Census 2000 and census tract information is available at www.census.gov.

Fetal death

The definition used in this state is that of the World Health Organization, which is as follows: "Fetal death means death prior to complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy; the death is indicated by the fact that, after such expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as the beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles."

This category includes both induced terminations and spontaneous fetal deaths.

Induced termination is a fetal death where the pregnancy has been deliberately terminated with the purpose of producing a nonviable fetus. Molar and ectopic pregnancies are excluded.

A spontaneous fetal death is a fetal death that is not an induced abortion and includes miscarriages, stillbirths, and ectopic pregnancies.

Infant death is defined as a death occurring within the first year of life.

Neonatal deaths are infant deaths that occurred prior to the 28th day of life.

Post-neonatal deaths are infant deaths which occurred between the 28th day of life and before the first birthday.

Low birth weight infants are those weighing 2500 grams (5 lbs. 8 ozs.) or less.

Maternal death

Is defined by the International Classification of Diseases, 9th Revision, as "the death of any woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes". This definition is used in Rhode Island for classifying maternal deaths.

Perinatal mortality, as used in this report, refers to fetal deaths of 28 weeks or more uterogestation combined with deaths that occurred before the seventh day of life.

Residence is the city or town where the deceased resided for a death, where the mother resided for a birth, or where the patient resided for a spontaneous fetal death or induced abortion.

Technical Notes and Usage:

Step-By-Step Instructions*

Data users are diverse, including public-health officials evaluating a program by using death data, demographers projecting school enrollments with birth data, and business people deciding to open a formal-wear shop based on marriage data. Many of these users have a thorough knowledge of statistics. But others find the entire subject-matter confusing and intimidating. For either group, a misunderstanding of what vital statistics mean can lead to wrong conclusions. Therefore, this section is included to provide an overview of how to use vital statistics. It is addressed to the person looking at vital events for the first time, but the experienced user may also find a review helpful.

STEP 1: FINDING THE CORRECT NUMBER

The first step is to determine how many of a particular vital event took place during the year. This involves asking two questions:

Which event or events are appropriate?

DEATHS
INFANT DEATHS
NEONATAL DEATHS
POST-NEONATAL DEATHS
FETAL DEATHS
LOW BIRTH WEIGHT INFANTS
PREGNANCIES
INDUCED ABORTIONS
MARRIAGES
DIVORCES

This may not be as simple as it sounds. For one thing, examining more than one type of event may be required. For example, a researcher who is concerned with teenage pregnancies will have to consider abortions and fetal deaths, not simply the number of births.

Deciding which events to use is important since sometimes the choice of one event over another can lead to vastly different conclusions.

*Technical Notes reprinted, in part, courtesy of the Oregon Center for Health Statistics; illustrative examples were changed to reflect Rhode Island data. Effective with the 1999 Annual Report, the Comparability Ratios section has been updated to reflect changes to mortality data classifications from ICD-9 to ICD-10.

Who should be counted?

If you are a hospital planner who is deciding to expand or contract delivery services, you want to count the number of births which occurred in your area, regardless of where the parents live. If you are projecting school enrollment, you want to count only how many children will potentially be residing in your area. Fortunately, vital events are usually reported so that both of these data needs can be met.

OCCURRENCE DATA	The event (the death, birth, marriage, etc.) actually took place in the city or town. The person participating in the event may have lived in Podunk, New York.
RESIDENCE DATA	The person involved in the event lived in the geographic region mentioned, but the event itself may have taken place anywhere in the United States or Canada. In other words, a resident of Providence who died in an accident while on vacation in Michigan has been added to the city of Providence resident death figure

When in doubt about which type of data to use, resident figures are usually the best choice. Most birth and death data are published by residence, which means that comparisons with other states or the United States as a whole will be easier. Exceptions to this rule are listed in the individual sections.

Once the right event has been determined, and the choice between occurrence and residence data has been made, the statistician can find the correct figures in the table(s) in this book. If the needed table is not listed, contact the Office of Vital Records for more information.

Once the right event has been determined, and the choice between occurrence and residence data has been made, the statistician can find the correct figures in the table(s) in this book. If the needed table is not listed, contact the Office of Vital Records for more information.

STEP 2: MAKING THE NUMBER MEANINGFUL WITH RATES AND RATIOS

In many instances simply knowing the number of events is not sufficient. A. Bradford Hill expressed this important statistical concept:

> "It is well recognized that white sheep eat more
> than black sheep--because there are more of them."

For example, we know more people died in Providence than in New Shoreham, because Providence has a much larger population. But what is the likelihood of dying in each municipality?

In order to answer this question, statisticians calculate rates. This means that the number of events which occurred is compared to the population for which that event could have occurred, and the figure is then standardized to some number (such as 1,000 or 100,000) for convenience.

Here is an example:

$$\text{CRUDE DEATH RATE} = \frac{\text{DEATHS (The number of people who died)}}{\text{POPULATION}} \times 1{,}000$$

The more specifically a statistician can define the "population at risk" (the denominator or bottom part of the formula), the more meaningful the rate is. For example, the crude birth rate, which compares the number of births to the population, is not nearly as informative as the fertility rate, which uses only the number of women of childbearing age (15-44) for comparative purposes. The fertility rate is not distorted by changes in the number of men or pre-pubescent or post-menopausal women in the population. (The turn of the century notion that only married women between the age of 15 and 44 would be considered at risk of pregnancy has been abandoned for obvious reasons.)

Unfortunately, we do not always have the correct denominator for the equation. In these situations a substitute is used. For example, how many people are at risk of getting divorced? The number of married people is only available for census years. As a substitute, the crude divorce rate is calculated using the total population regardless of marital status. In other situations, the event is simply compared to another related number. For instance, the abortion ratio compares the number of abortions to the number of births. This is easier and more accurate than trying to determine the true denominator, which is the total number of pregnant women.

When calculating rates and ratios, great care must be taken to make certain that the appropriate time periods, geographical boundaries, and populations are used.

STEP 3: COMPARING TWO OR MORE NUMBERS

Numbers are more meaningful when they are converted into rates and ratios. But problems can arise when rates or ratios are compared for different geographical areas, different time periods, or different categories such as men versus women.

Taking Age, Sex, And Race Into Account

Before comparing two places or two time periods, always compare the population characteristics, such as age, sex, and race, first. If discrepancies are noted in any relevant variables, then the rates should be adjusted or standardized in order to make the comparisons free of differences in the structure of the populations.

Chance variation

Statisticians expect a certain amount of chance variation and have methods to take this into account. The confidence interval uses the number of cases and their distributions to determine what the rate "really is". If two rates have overlapping confidence intervals, then the difference between them may be due to this chance variation. In other words, the difference is not statistically significant. When comparing rates and ratios, differences should be tested for statistical significance.

Small numbers

Chance variation is a common problem when the numbers being used to calculate rates are extremely small. Large swings often occur in the rates, which do not reflect real changes. Consider Rhode Island's non-white infant mortality rates for a five-year period, shown below:

Year	Non-White Births	Non-White Infant Deaths	Non-White Infant Death Rates
1984	1313	18	13.7
1985	1337	12	9.0
1986	1456	20	13.7
1987	1571	17	10.8
1988	1698	22	13.0
1984-88	7375	89	12.1

The rates may vary widely from year to year. Note the difference in the 1984 non-white infant death rate, even though there was only one more infant death occurring in 1984 than there was in 1987.

Many rates based on small numbers are published in this book because readers demand them. But anyone preparing to make important decisions based on these rates should be very cautious. Consider this rule of thumb: a rate based on 20 cases has a 95% confidence interval about as wide as itself (the interval for a rate of 50 is between 25 and 75). Even large differences between two rates based on 20 cases or less are probably not statistically significant.

If 20 are too few, how many cases are sufficient to say that a true difference exists? Unfortunately we have no easy rules for this. To be safe, the vital statistician should always try to combine several years of data or consolidate geographical areas. Confidence intervals should be calculated, and differences should be tested for statistical significance.

Changes in measurement

Another problems is that the numbers being compared have not always been based on the same type of measurement. Definitions, population estimates, certificates, and coding procedures change from time to time as the need arises, e.g., the change in cause-of-death classification from the International Rules for the Classification of Diseases ICD-9 to the ICD-10. This can create "artificial" differences and can disguise "real" differences. The cause-of-death item provides an excellent example of changes in comparability:

In 1998, 383 people died Due to influenza & Pneumonia	RATE = 38.8 PER 100,000 POPULATION
In 1999, 301 people died Due to this cause	RATE = 30.4 PER 100,000 POPULATION

It appears that the incidence of Influenza & Pneumonia decreased. Actually, a change to coding and classification rules in the ICD-10 made it much less likely that Influenza & Pneumonia would be selected as the underlying cause of death (see explanation below):

Changes to Mortality Data Classifications: ICD-9 to ICD-10 Comparability Ratios

Effective with 1999 deaths, the Tenth Revision of the International Classification of Diseases (ICD-10) replaced the ICD-9, which had been used since 1979. The first ICD was developed in 1900 to promote international comparability and standards in the collection, classification, processing and presentation of health

statistics. It represented a collaborative effort of the World Health Organization (WHO), the National Center for Health Statistics (NCHS) in the US Department of Health and Human Services and nine other international centers. The United States is required to use the ICD under an agreement with WHO.

It is important to revise the ICD periodically to reflect advances in medical science and changes in medical diagnoses. While such revisions are essential to monitor the population's health, such changes have implications for mortality trend analysis.

The ICD-10 differs substantially from ICD-9 in the following ways:

- ICD-10 includes much more detail - 8,000 categories vs. 4,000 in ICD-9.

- ICD-10 uses alphanumeric codes, rather than the numeric codes used in the past

- Cause-of-death titles have been changed, e.g., "Chronic obstructive pulmonary disease" has been re-titled "Chronic lower respiratory disease"

- Medical conditions have been transferred to other classifications, e.g., "Drugs causing adverse effects in therapeutic use" has been removed from the category "Accidents" and placed in a new category entitled "Complications of medical and surgical care"

- Some coding and classification rules have been changed, e.g., "Pneumonia" is much less likely to be selected as the cause of death under ICD-10 rules.

For the above-listed reasons, direct comparisons of causes of death between 1999 and previous years are problematic. To assist data users in understanding these discontinuities, NCHS has developed comparability ratios that can be applied to mortality data from 1994-1998 for most causes of death. In cases where ratios were considered unreliable, NCHS did not publish comparability ratios. For more information on comparability ratios, see "National Vital Statistics Reports, Volume 49, Number 2, May 18, 2001" available on the NCHS web site http://ww2.cdc.gov.nchs

The purpose of a comparability ratio is to measure whether the difference in the number of deaths in a particular cause-of-death category is a reflection of a true change or a result of the change in the classification system. While most causes have a comparability ratio of 1.00 indicating a close match, others, e.g., Alzheimer's Disease (1.55) and Influenza & Pneumonia (0.6982) have less

comparable ratios. The larger the variance from 1.00, the greater the discontinuity in the trend for the specific public health problem causing the death.

In order to compare death rates from certain causes for the years 1999-forward with the death rates for a year or years during the period 1979-1998, the estimated number of deaths from those causes during the early period must be derived by the use of comparability ratios, which were computed by the National Center for Health Statistics from the results of dual coding of certificates according to the old and the new procedures. The comparability ratios are the number of deaths classified to a given cause by the Tenth Revision divided by the number of deaths classified to that cause by the Ninth Revision. Comparability ratios have been published by the National Center for Health Statistics in the *National Vital Statistics Report*, Vol. 49, No. 2, May 18, 2001 and appear in *Table 7 of the Rhode Island Annual Report of Vital Statistics.*

STEP 4: ANALYZING THE DATA

The first three steps have been fairly mechanical:

(1) Choose the correct events and the correct group to determine the number of events which took place for the geographical areas and time periods.

(2) Calculate the rates.

(3) Compare these rates to determine if the differences are statistically significant.

NOW the vital statistician must begin to ask the difficult questions. If we find that two rates are statistically significantly different, how can we find out why they are different? If the differences which we expected did not prove to be significant, is there another item which perhaps is masking an actual difference? Frequently the statistician has to refine the research question and begin all over again.

Table A: VITAL STATISTICS SUMMARY

Table A, shown below, compares vital statistics data and averages rates for the five-year period 1999-2003 with average rates for the years 1989-1993. Rates averaged over five years reduce the effect of random fluctuations that may occur when comparing single years.

(A) Average rate per 1,000 population according to the 2000 census

(B) Average ratio per 1,000 live births 1999-2003

(C) Rate based on a denominator of less than 500 live births and may be statistically unreliable

(D) Rate based on a denominator of less than 5,000 population and may be statistically unreliable

* The equivalent of the gram weights in terms of pounds an ounces are as follows:

1000 GR OR LESS - 2 LB 3 OZ OR LESS
1001 - 1500 GR = 2 LB 4 OZ - 3 LB 4 OZ
1501 - 2000 GR = 3 LB 5 OZ - 4 LB 6 OZ
2001 - 2500 GR = 4 LB 7 OZ - 5 LB 8 OZ
2501 - 3000 GR = 5 LB 9 OZ - 6 LB 9 OZ
3001 - 3500 GR = 6 LB 10 OZ - 7 LB 11 OZ
3501 - 4000 GR = 7 LB 12 OZ - 8 LB 13 OZ
4001 - 4500 GR = 8 LB 14 OZ - 9 LB 14 OZ
4501 - 5000 GR = 9 LB 15 OZ - 11 LB 0 OZ
5001 GR OR More = 11 LB 1 OZ OR More

** Total may include births of unknown weight

Low birth weight refers to infants who weighed 2500 grams (5 Lb 8 Oz) or less

TABLE 20 - ALL FETAL DEATHS OCCURRING IN RI
BY CAUSE OF DEATH (ICD-10, 1992): 2003

	Number	Percent
All Causes	**6801**	**100.0**
Specific		
Congenital Abnormalies (Q00-Q99)	5	0.1
Certain conditions originating in the perinatal period (P00-P96)	6796	99.9
Maternal complications of pregnancy (P01)	1161	17.1
Complications of placenta, cord & membranes (P02)	14	0.2
Short gestation & low birth weight not elsewhere classified (P07)	12	0.2
Intrauterine hypoxia & birth asphyxia (P20)	1	0.0
Infections specific to the perinatal period (P35-P39)	9	0.1
Transitionary disorders of carbohydrate metabolism (P70)	1	0.0
Other conditions arising in the perinatal period (P80-P96)	5598	82.3
Other conditions of integument (skin) (P83)	3	0.0
Unspecified cause (P95)	111	1.6
Termination of pregnancy (P96.4)	5482	80.6
Other	2	0.0

TABLE 23 - RHODE ISLAND RESIDENTS INFANT DEATHS FOR 130 SELECTED CAUSES** BY AGE: 2003

Cause of Death (ICD-10 Codes)	**All Infants***	Neonatal (-28 Days)	Under 1 Day	1-6 Days	7-27 Days	28 Days - Under 1 Yr.
Neoplasms (Cancers) [C00-D48]	**3**	**0**	**0**	**0**	**0**	**3**
In situ neoplasms, benign neoplasms & neoplasms of uncertain/unknown behavior [D00-D48]	**2**	0	0	0	0	2
Other and unspecified malignant neoplasms [C00-C80, C88-C90, C96-C97]	**1**	0	0	0	0	1
Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism [D50-D89]	**1**	1	1	0	0	0
Anemias [D50-D64]	**1**	1	1	0	0	0
Diseases of the circulatory system [I00-I99]	**2**	**0**	**0**	**0**	**0**	**2**
All other diseases of circulatory system [I00-I25, I31, I34-I38, I44-I45, I47-I51, I70-I99]	**1**	0	0	0	0	1
Cerebrovascular diseases [I60-I69]	**1**	0	0	0	0	1
Diseases of the respiratory system [J00-J98]	**1**	**0**	**0**	**0**	**0**	**1**
Other & unspecified diseases of respiratory system [J22, J30-J39, J43-J44, J47-J68, J70-J98]	**1**	0	0	0	0	1
Certain conditions originating in the perinatal period [P00-P96]	**57**	**55**	**47**	**2**	**6**	**2**
All other infections specific to the perinatal period [P35, P37, P39]	**1**	1	1	0	0	0
All other respiratory conditions originating in the perinatal period [P28.2-P28.9]	**1**	1	0	0	1	0
Bacterial sepsis of newborn [P36]	**3**	3	1	0	2	0
Birth asphyxia [P21]	**1**	1	0	0	1	0
Respiratory distress of newborn [P22]	**3**	3	1	2	0	0
Chronic respiratory disease originating in the perinatal period [P27]	**2**	0	0	0	0	2
Disorders related to short gestation and low birth weight, not elsewhere classified [P07]	**32**	32	32	0	0	0
Extremely low birth weight or extreme immaturity [P07.0, P07.2]						
Other low birth weight or preterm [P07.1, P07.3]						
Hematological disorders [P60-P61]	**1**	1	0	0	1	0
Necrotizing enterocolitis of newborn [P77]	**1**	1	0	0	1	0
Newborn affected by complications of placenta, cord, and membranes [P02]	**5**	5	5	0	0	0
Newborn affected by chorioamnionitis [P02.7]						
Newborn affected by complications involving placents [P02.0-P02.3]						
Newborn affected by maternal complications of pregnancy [P01]	**5**	5	5	0	0	0
Newborn affected by incompetent cervix [P01.0]						
Newborn affected by other maternal complications of pregnancy [P01.2-P01.4, P01.6-P01.9]						
Newborn affected by premature rupture of membranes [P01.1]						
Newborn affected by other complications of labor and delivery [P03]	**1**	1	1	0	0	0
Other perinatal conditions [P29, P70.3-P76, P78-P81, P83.0-P83.1, P83.3-P96]	**1**	1	1	0	0	0

TABLE 23 (Cont.) - RHODE ISLAND RESIDENTS INFANT DEATHS FOR 130 SELECTED CAUSES** BY AGE: 2003

Cause of Death (ICD-10 Codes)	All Infants*	Neonatal (-28 Days)	Under 1 Day	1-6 Days	7-27 Days	28 Days-Under 1 yr.
Congenital malformations, deformations and chromosomal abnormalities [Q00-Q99]	**9**	**7**	**4**	**2**	**1**	**2**
Anencephaly and similar malformations [Q00]	**1**	1	1	0	0	0
Congenital malformations of genitourinary system [Q50-Q64]	**1**	1	0	1	0	0
Congenital malformations of heart [Q20-Q24]	**2**	1	0	0	1	1
Congenital malformations of respiratory system [Q30-Q34]	**1**	1	1	0	0	0
Other chromosomal abnormalities, not elsewhere classified [Q92-Q99]	**1**	1	1	0	0	0
Other congenital malformations and deformations [Q10-Q18, Q86-Q89]	**2**	1	1	0	0	1
Spina bifida [Q05]	**1**	1	0	1	0	0
Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified [R00-R99]	**6**	**1**	**0**	**0**	**1**	**5**
Other symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified [R00-R53, R55-R94, R96-R99]	**2**	0	0	0	0	2
Sudden infant death syndrome [R95]	**4**	1	0	0	1	3
External causes of mortality [V01-Y89]	**6**	**1**	**1**	**0**	**0**	**5**
Accidents (unintentional injuries) [V01-X59]	**5**	0	0	0	0	5
Assault (homicide) [X85-Y09]	**1**	1	1	0	0	0
Others	**3**	**1**	**0**	**0**	**1**	**2**
Gastritis, duodenitis, and noninfective enteritis and colitis [K29, K50-K55]	**1**	0	0	0	0	1
Infantile spinal muscular atrophy, type I (Werdnig-Hoffman)[G12.0]	**1**	1	0	0	1	0
Other diseases of nervous system [G06, G06, G11, G12.1-G12.9, G20-G72, G81-G92, G93.0, G93.2-G93.9, G95-G98]	**1**	0	0	0	0	1

* Total(s) may include infants of unknown age

**The causes of death in this table are taken from the ICD-10 Cause-of-Death list of 130 Selected Causes of Infant Death for Tabulating Mortality Statistics for Health Statistics. If no deaths occurred in a specific classification, the category will not appear in this table.
